

ACL and VTY line lab exercise

In this lab you will have to configure a standard access control list and an extended access control list. All basic configuration of the devices has been completed and does not have to be done.

On R1:

1. Create a standard ACL with the number 1 and allow PC0 to reach R2's active interface. Apply this ACL in the inbound direction.
2. From PC0, ping R2's active interface. This should work!
3. From PC1, ping R2's active interface. This shouldn't work!

On R2:

1. On VTY line 0-4, enable telnet traffic.
2. Set the VTY password to "cisco".
3. Configure an extended ACL with the number 101 to allow **only telnet** traffic from R1 to R2.

On R1 again:

1. Try to ping R2. This shouldn't work!
2. Try to Telnet into R2. This should work!
