

NAT lab exercise

In this lab you will have to configure NAT on two routers: R1 and R2. On R1 you will have to configure dynamic NAT with overload (PAT) and static NAT on R2. All basic configuration of the devices has been completed and does not have to be done.

1. On R1:
 - a. Configure the correct inside and outside interfaces.
 - b. Create a numbered standard ACL that identifies the 192.168.1.0/25 inside network as eligible for NAT translation.
 - c. Create a NAT pool named "POOL" and use the 50.0.0.1 /32 address.
 - d. Configure PAT so that the permitted inside addresses are translated using the single global address from the NAT pool.
2. On R2:
 - a. Configure static NAT so that Server1 is reachable by the global address: 60.0.0.1.
 - b. Configure the correct inside and outside interfaces.
3. From PC1 ping the outside global address of Server1.
4. From PC2 ping the outside global address of Server1.
5. Check the NAT translation table on R1.
